

# Unikernels

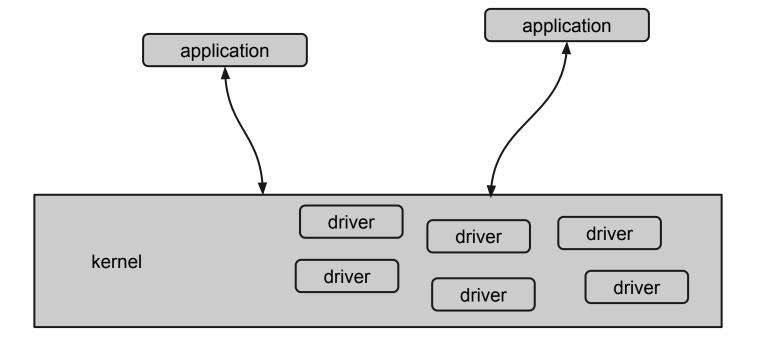

### No OS? No Problem!

Kevin Sapper WAMOS 2015

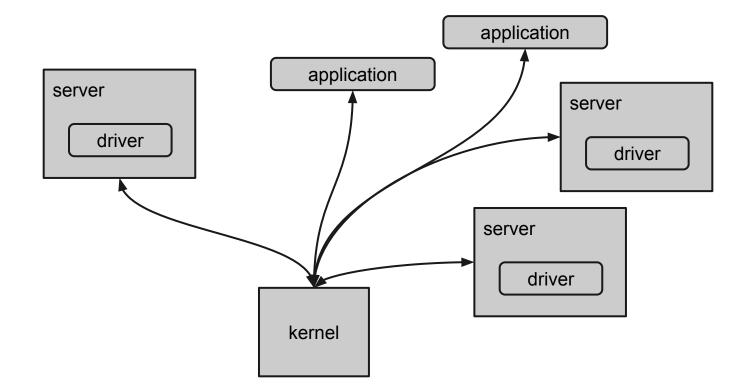

### Outline

- What is a unikernel?
- Rump Kernels
- Demo

### What is a unikernel?

### What is a unikernel?

### What is a unikernel?

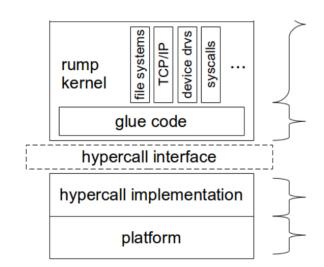

application		
driver		
kernel		

#### Aims to run anywhere

POSIX (and javascript)

Linux Xen QEMU/KVM bare-metal

unmodified NetBSD code (~10<sup>6</sup> lines)

platform-independent glue code (~10<sup>4</sup> lines)

platform-specific code (~10<sup>3</sup> lines) e.g., Genode OS, Xen, userspace, bare-metal, ...

#### Aims to run anywhere

POSIX (and javascript)

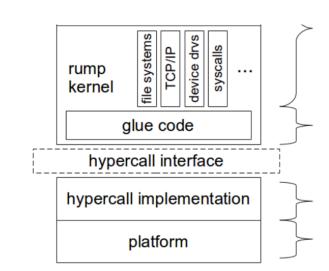

Portable Operating System Interface defines API for Processes, Threads, Signals, Timer, Pipes, I/O,

....

POSIX-compliant OS are NetBSD, Contiki, PikeOS,

. . .

unmodified NetBSD code (~10<sup>6</sup> lines)

platform-independent glue code (~10<sup>4</sup> lines)

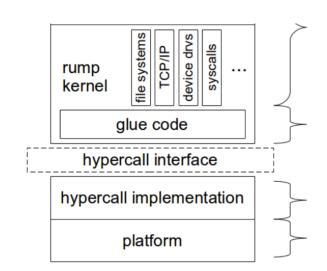

platform-specific code (~10<sup>3</sup> lines) e.g., Genode OS, Xen, userspace, bare-metal, ...

#### Aims to run anywhere

POSIX (and javascript)

Linux Xen QEMU/KVM bare-metal

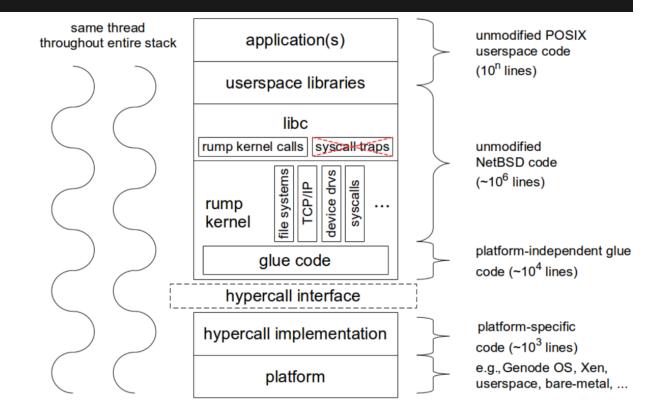

### Anykernel

unmodified NetBSD code (~10<sup>6</sup> lines)

platform-independent glue code (~10<sup>4</sup> lines)

platform-specific code (~10<sup>3</sup> lines) e.g., Genode OS, Xen, userspace, bare-metal, ...

Can run **unmodified** POSIX applications.

No interrupts -> run to completion

Rump Kernels **CANNOT**:

- execute binaries
- schedule threads
- deal with privileged instructions
- use virtual memory
- handle page fault

Uses host threads and scheduling policy

same thread throughout entire stack	application(s)	
)	userspace libraries	$\prec$
$\leq \leq$	libc rump kernel calls syscall-traps	
$\leq$	file systems TCP/IP device drvs syscalls	
) )	glue code	
	hypercall interface	
$\supset$	hypercall implementation	
	platform	

unmodified POSIX userspace code (10<sup>n</sup> lines)

unmodified NetBSD code (~10<sup>6</sup> lines)

platform-independent glue code (~10<sup>4</sup> lines)

platform-specific code (~10<sup>3</sup> lines) e.g.,Genode OS, Xen, userspace, bare-metal, ...

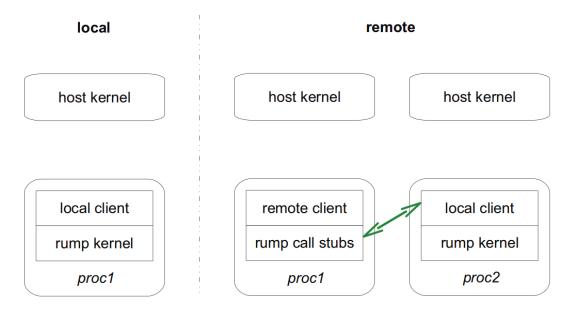

### **Rump Clients**

local

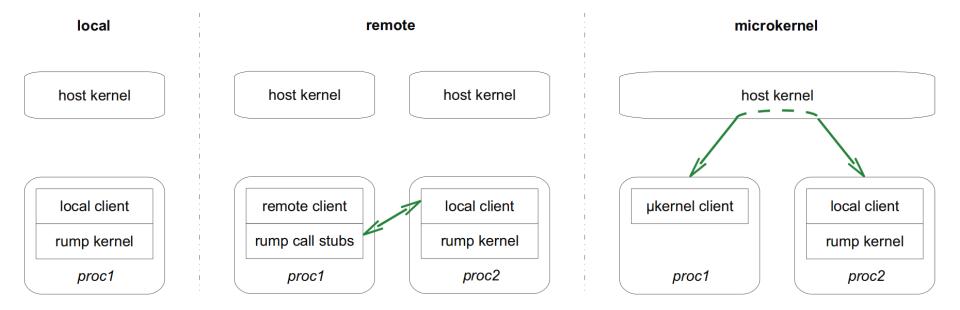

host kernel

local client rump kernel proc1

### **Rump Clients**

### **Rump Clients**

### Demo

### local client

- Hello World
- Filesystem access
- Network access

### remote client

- buildrump.sh (kernel + server)
- rumpctrl (userland utilities)
