# Timing Channels

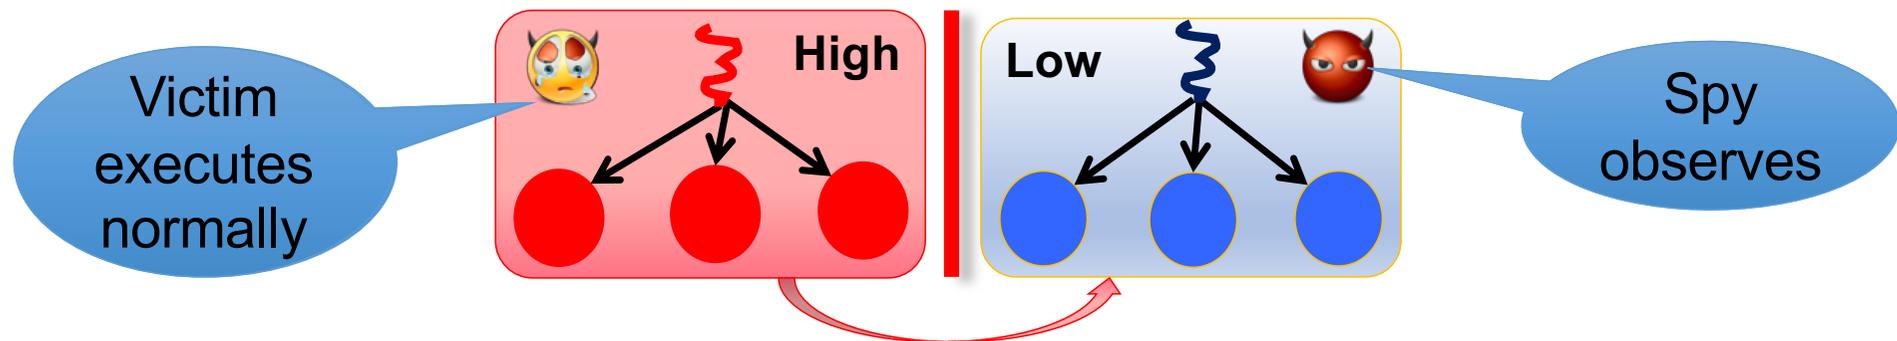

## Principles

# Refresh: Timing Channels

## Information leakage through timing of events

- Typically by observing response latencies or own execution speed

**Covert channel:** Information flow that bypasses the security policy

**Side channel:** Covert channel exploitable without insider help

# Causes of Timing Channels

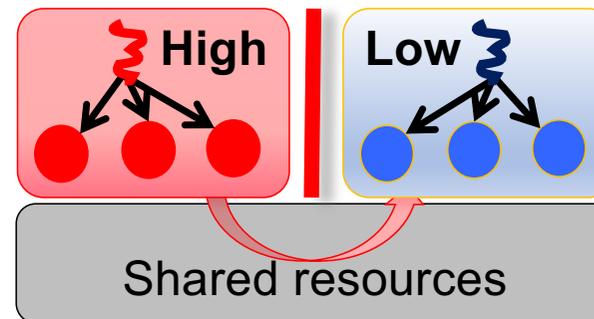

## Algorithmic

```
if (secret) {  
    short_operation(...);  
} else {  
    long_operation(...);  
}
```

## Resource Contention

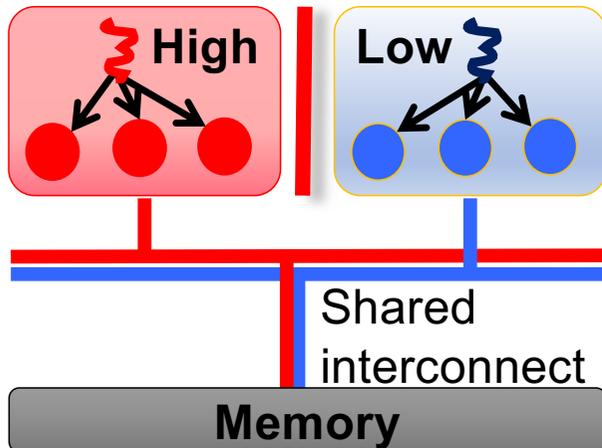

- Software resources
  - OS abstractions
  - buffer cache...
- Hardware resources
  - caches etc
  - not visible at ISA (HW-SW contract)

Micro-architectural timing channels

**Affect execution speed**

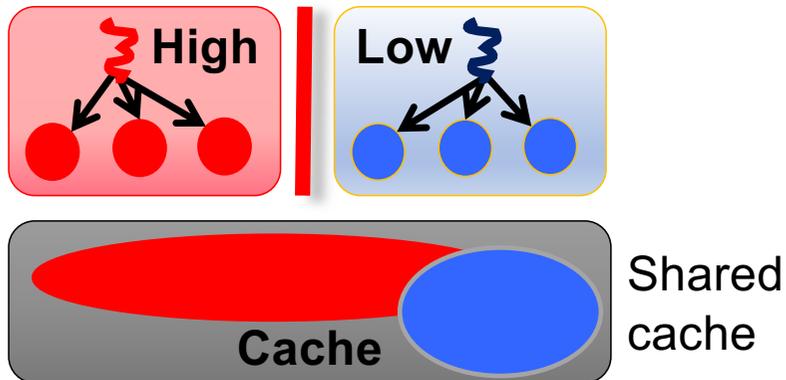

# Shared Hardware: Stateless Interconnect

H/W is *bandwidth-limited*

- Interference during concurrent access
- Generally reveals no data or addresses
- Must encode info into access patterns
- *Only usable as covert channel, not side channel*

# Shared Hardware: Stateful Resources

H/W is *capacity-limited*

- Interference during
  - concurrent access
  - time-shared access
- Collisions reveal addresses
- *Usable as side channel*

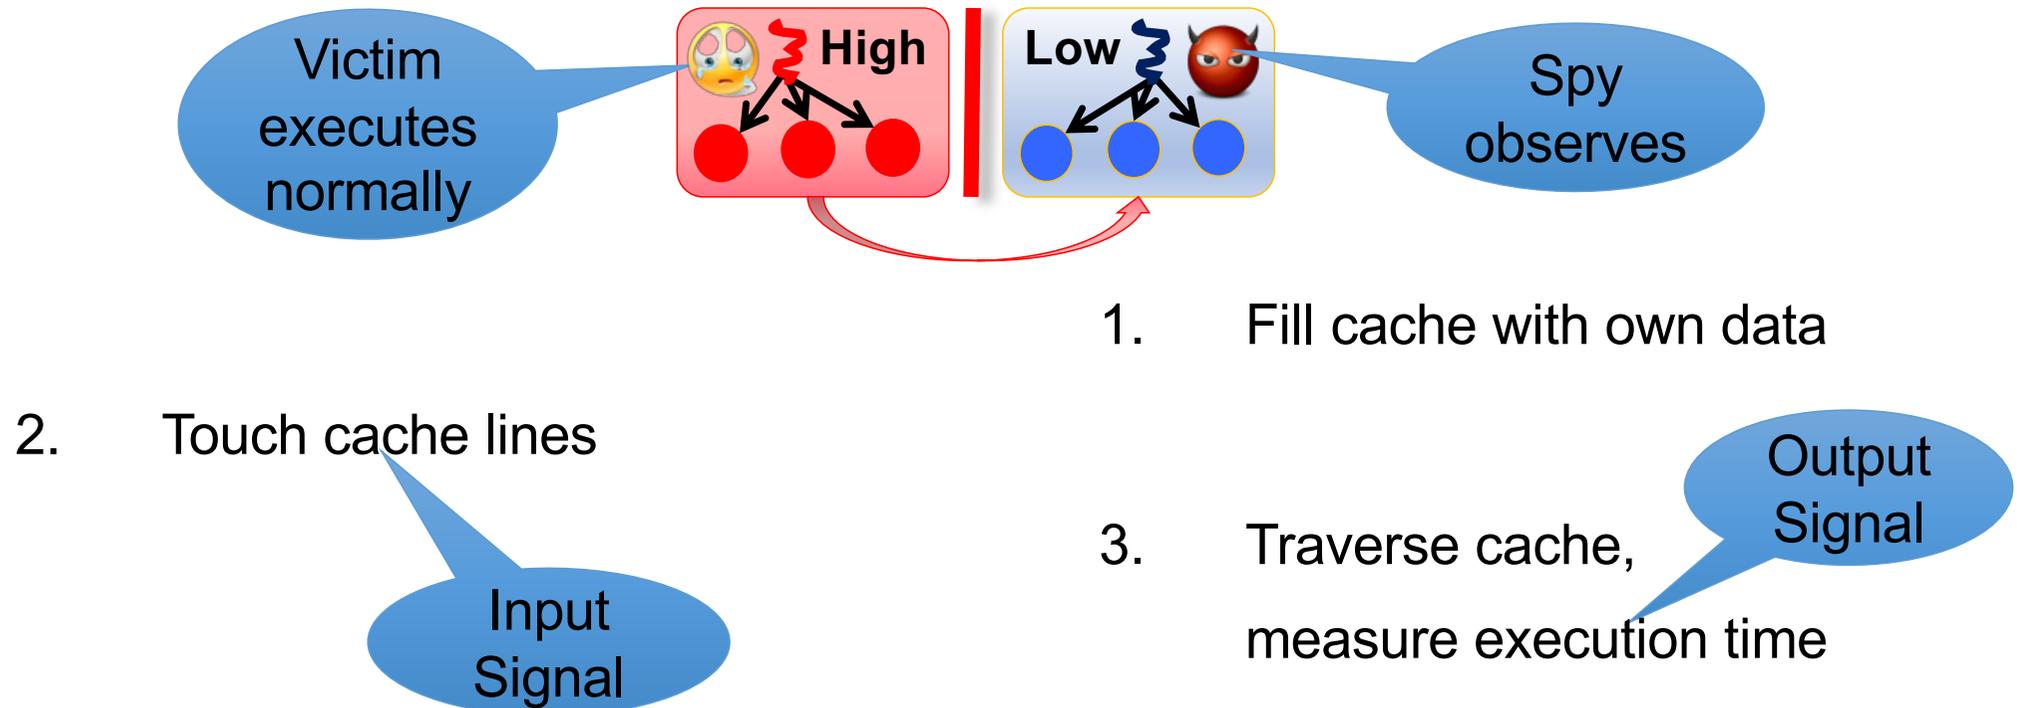

Can be any state-holding microarchitectural feature:

- CPU caches
- branch predictor
- pre-fetcher state machines

# Timing Channels

Example: LLC Side Channel

# Methodology: Prime and Probe

# Challenge: Slow LLC Access Times

- L1 (32 KiB) probe:
  - $64 \text{ sets} * 8 \text{ ways} * 4 \text{ cycles} = 2,048 \text{ cycles}$
- Small last-level cache (6 MiB):
  - $8,192 \text{ sets} * 12 \text{ ways} * \sim 30 \text{ cycles} = \sim 3,000,000 \text{ cycles}$

Probing entire LLC is too slow, but single set is fast

- Approach:

- *Probe one or a few cache sets at a time*
- *Find “interesting” sets (“eviction set”) by looking for patterns*

**Example:** Look for square code in square-and-multiply exponentiation of GnuPG

# Searching for square Code

**Modular reduction:  $r = b^e \bmod m$**

```
long_int r (long_int b, m, e) {  
    res = 1;  
    for (i = n-1; i >= 0; i--) {  
        if (e[i]) {  
            r = mod (r * b, m);  
        }  
    }  
    return res;  
}
```

$i^{\text{th}}$  bit of  $e$

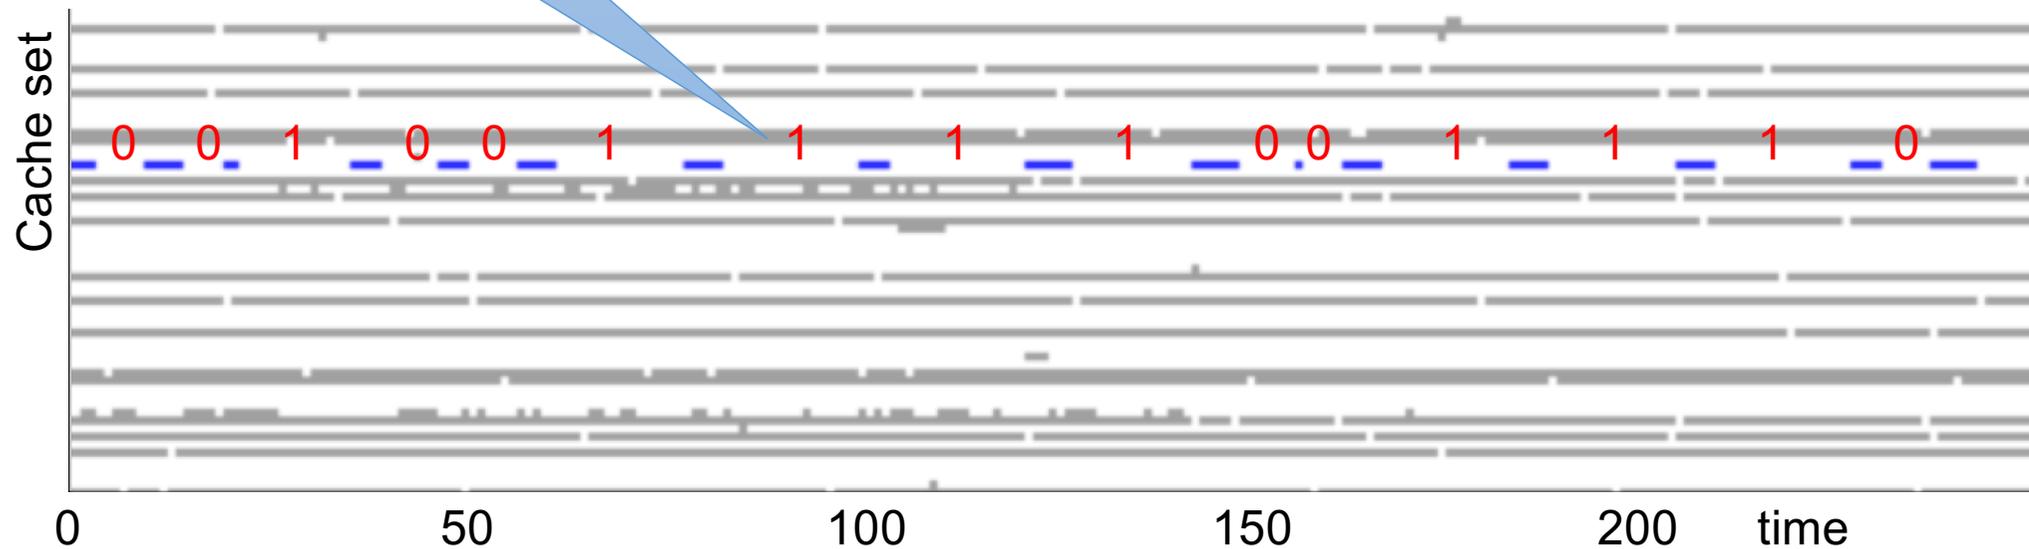

Long computation  
if bit is set

Expected pattern: Bursts of activity separated by longer or shorter intervals indicating modular reduction operation

# Searching for square Code

Can read out bits of exponent!  
[Liu S&P'15]

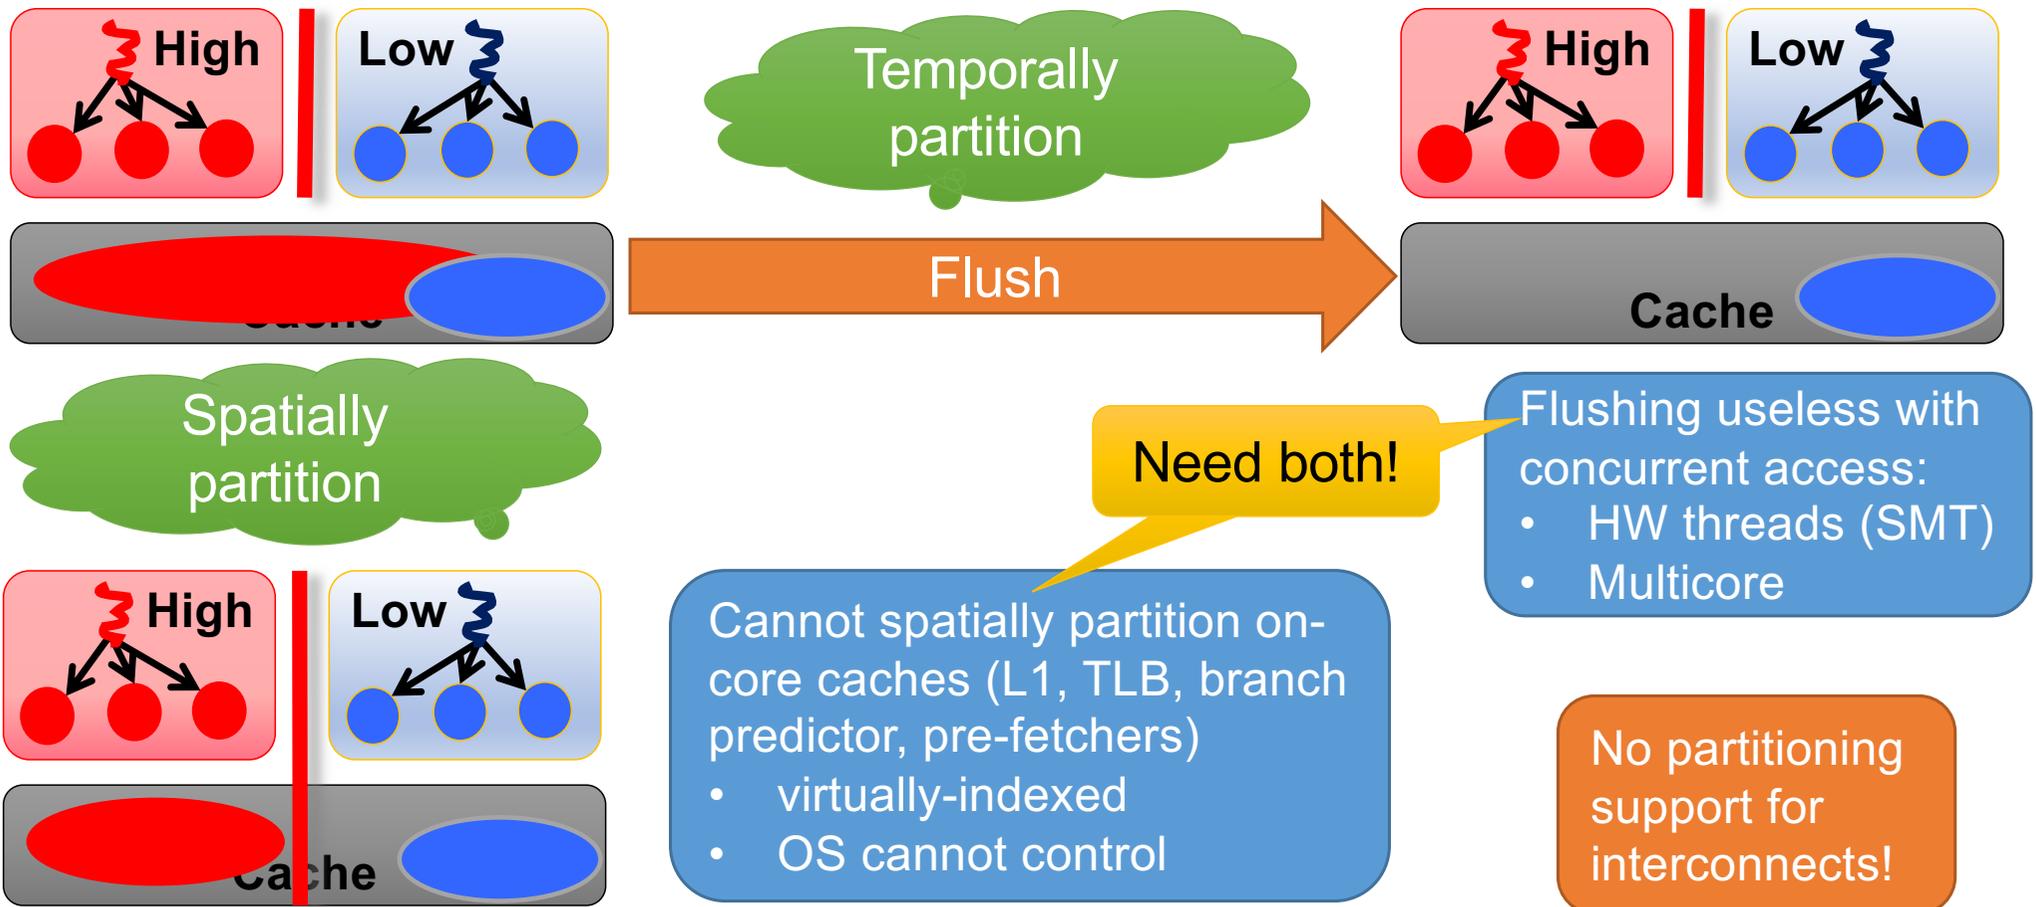

Expected pattern: Bursts of activity separated by longer or shorter intervals indicating modular reduction operation

# Timing Channels

Evaluating Hardware

# Timing-Channel Prevention: Partition HW

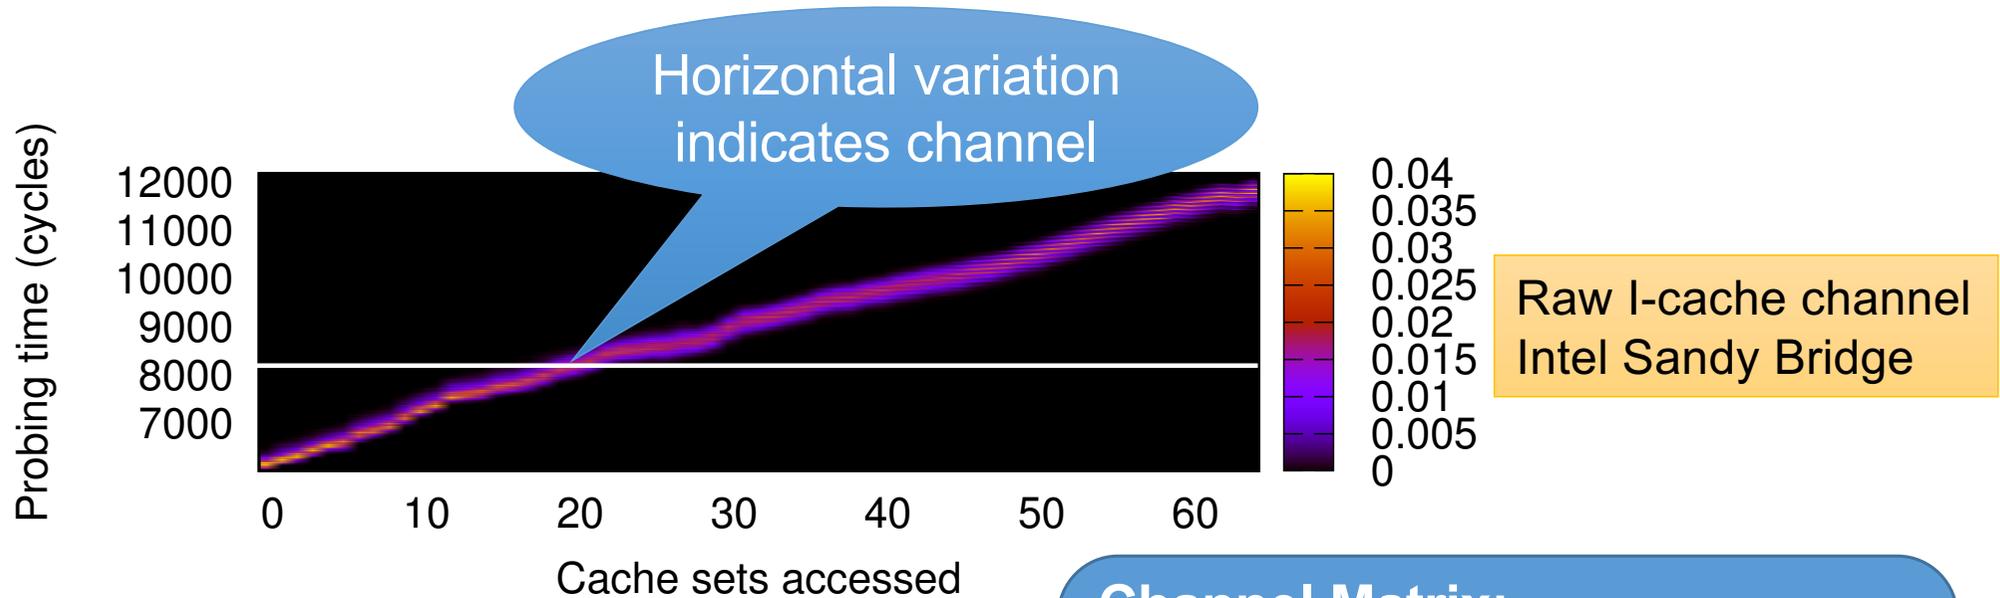

# Evaluating Intra-Core Channels

## Methodology:

- Flush all caches on context switch
  - using all flush ops provided by HW
- Run prime&probe *covert channel* attack

# Methodology: Channel Matrix

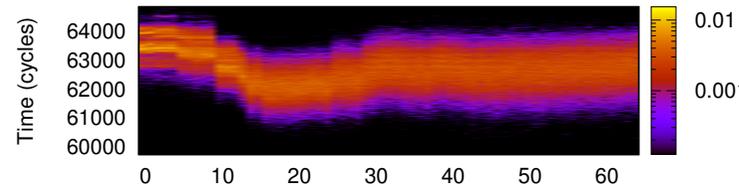

## Channel Matrix:

- Conditional probability of observing time  $t$ , given input  $n$ .
- Represented as heat map: bright = high probability.

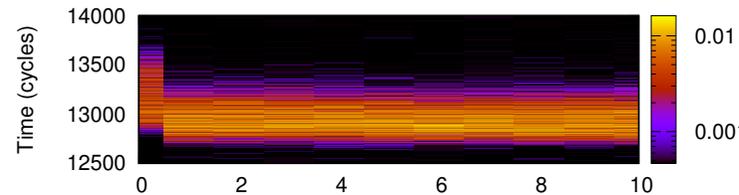

# I-Cache Channel With Full State Flush

**CHANNEL!**

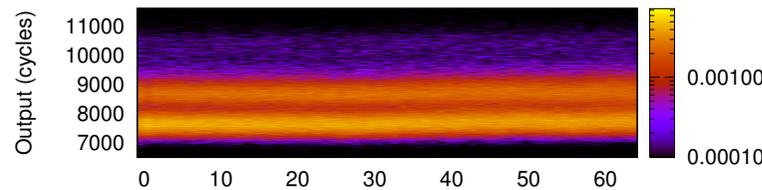

Intel Sandy Bridge

**CHANNEL!**

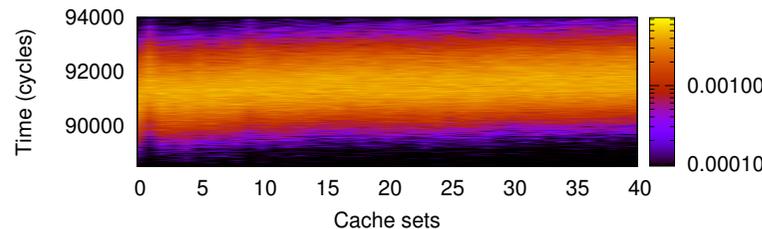

Intel Haswell

No evidence of channel

Intel Skylake

**SMALL CHANNEL!**

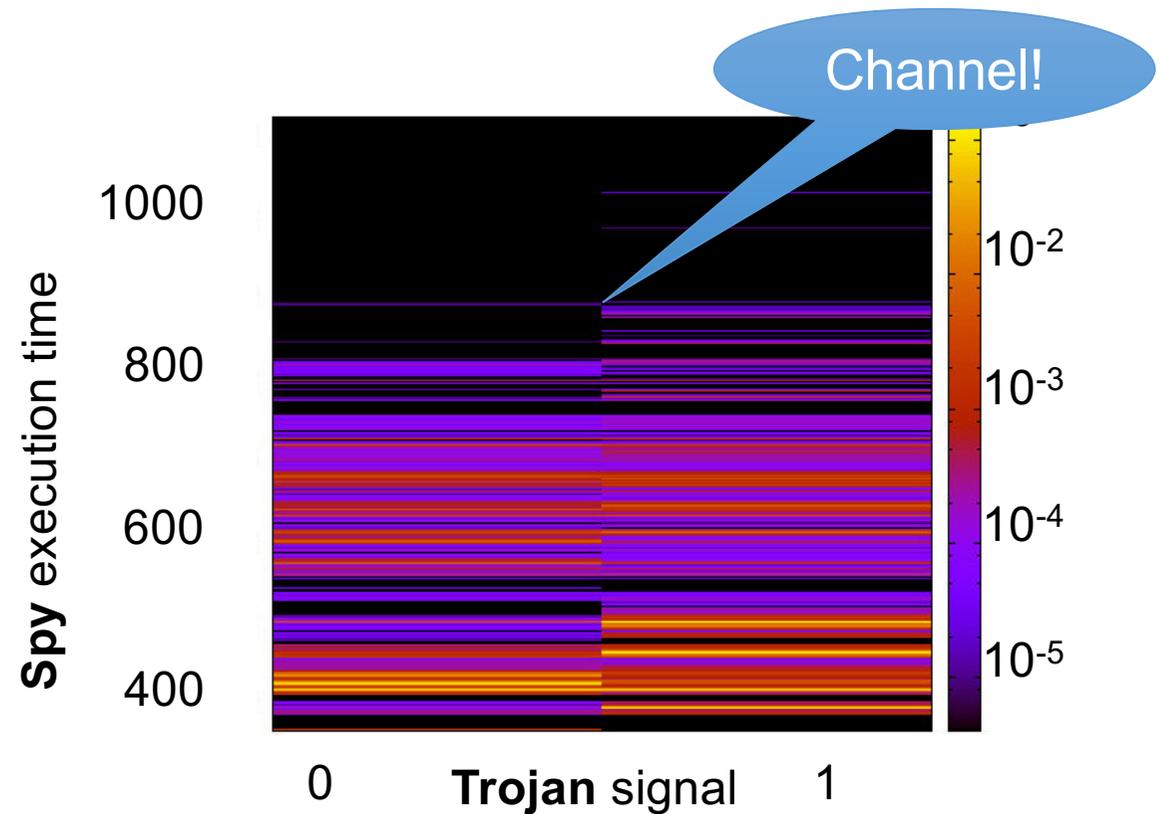

HiSilicon A53

# HiSilicon A53 Branch History Buffer

## Branch history buffer (BHB)

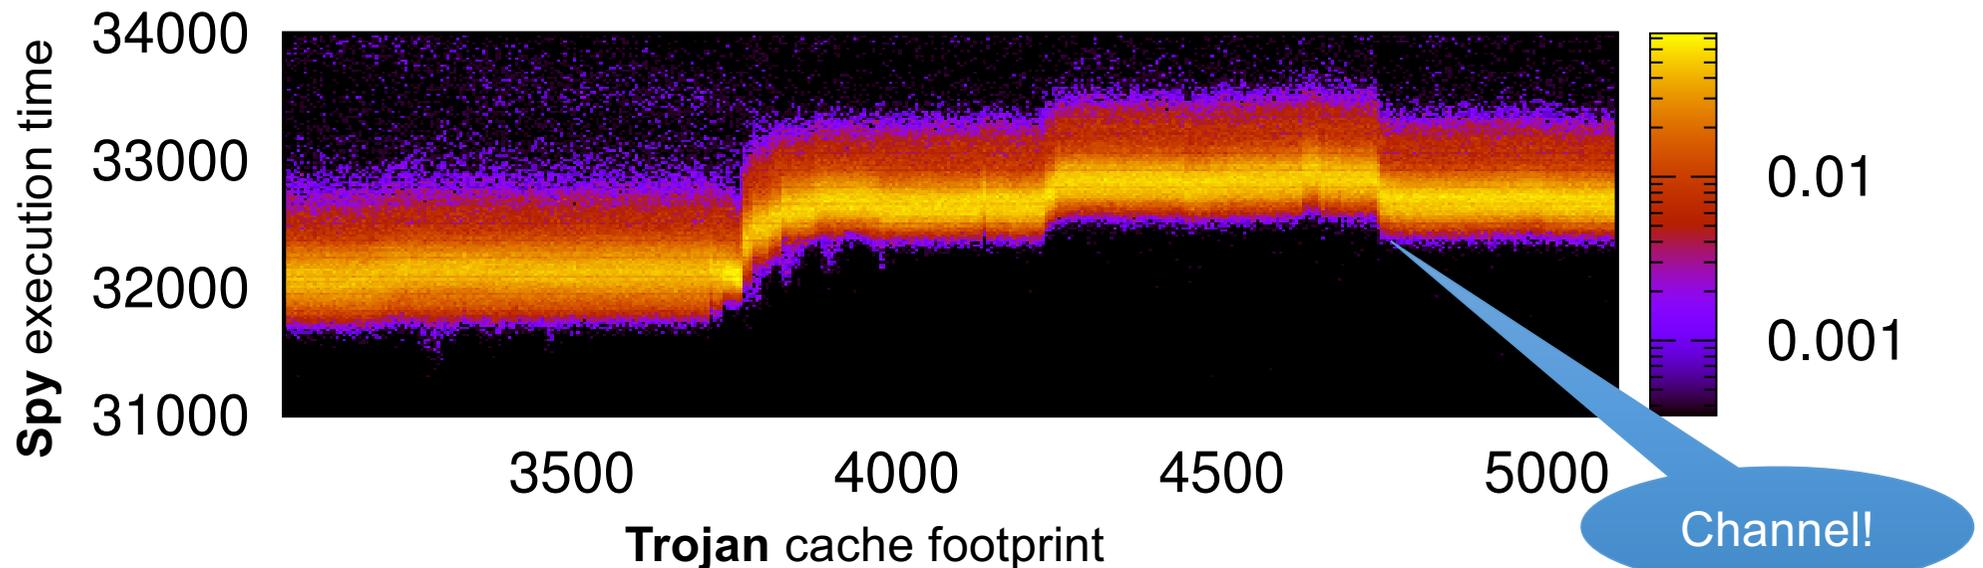

- Prediction of branch taken
- One-bit channel
- All reset operations applied

# Intel Haswell Branch Target Buffer

## Branch target buffer

- Prediction of branch destination
- All reset operations applied

# Result Summary: Measured Capacities

Channel	Sandy Bridge		Haswell		Skylake		ARM A9		ARM A53	
	raw	flush	raw	flush	raw	flush	raw	flush	raw	flush
L1 D-cache	4.0	0.04	4.7	0.43	3.3	0.18	5.0	0.11	2.8	0.15
L1 I-cache	3.7	0.85	0.46	0.36	0.37	0.18	4.0	1.0	4.5	0.5
TLB	3.2	0.47	3.2	0.18	2.5	0.11	0.33	0.16	3.4	0.14
BTB	2.0	1.7	4.1	1.6	1.8	1.9	1.1	0.07	1.3	0.64
BHB	1.0	1.0	1.0	1.0	1.0	1.0	1.0	0.01	1.0	0.5

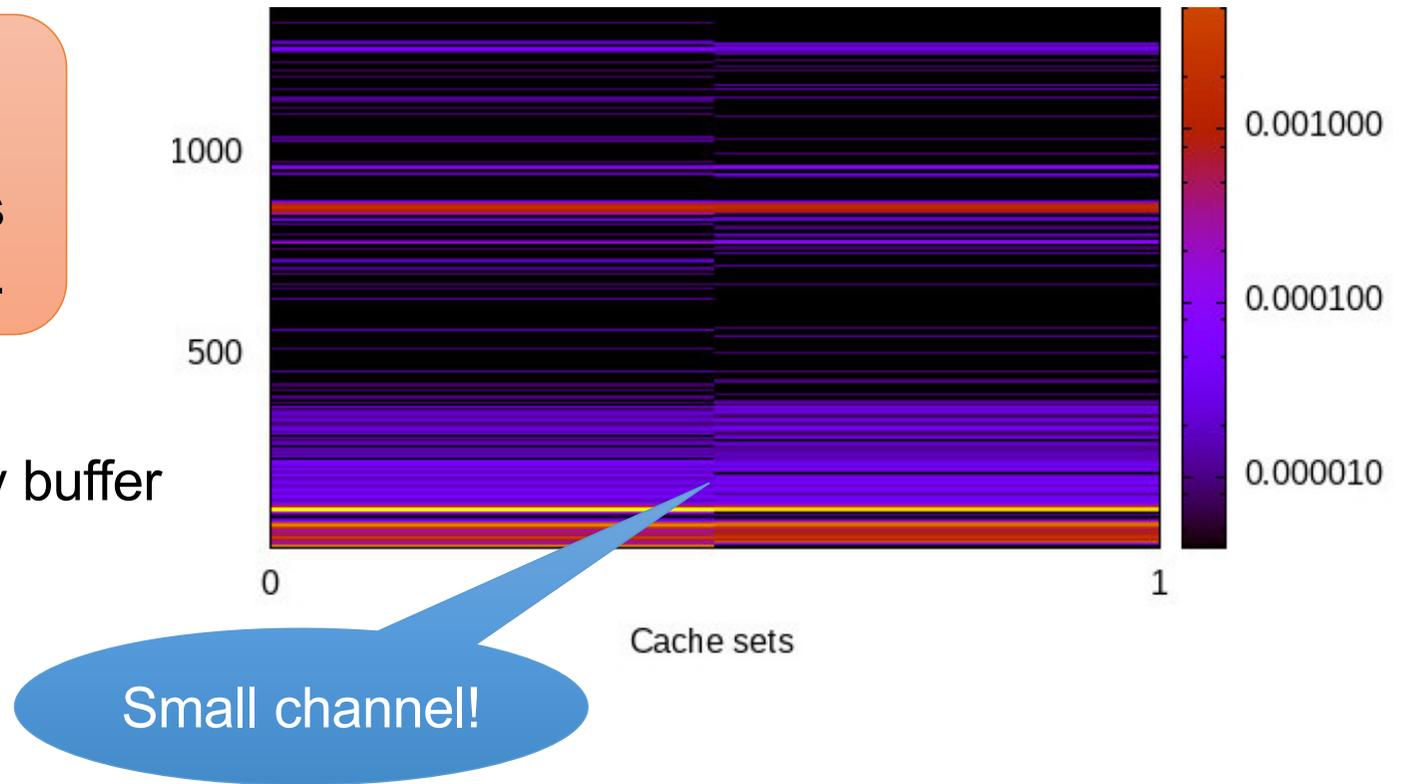

Residual channels

Uncloseable channel on each processor studied!

# Intel Spectre Defences

Intel added *indirect branch control (IBC)* feature, which closes most channels, but...

Intel Skylake  
Branch history buffer

# Speculating Disaster

# Instruction Pipelining

- Nominally, the processor executes instructions one after the other
- Instruction execution consists of multiple steps
  - Each uses a different unit

# Instruction Pipelining

- Nominally, the processor executes instructions sequentially
- Instruction execution consists of multiple steps
  - Each uses a different unit
- Pipelining concurrently instruction execution

$c = a / b;$   
 $d = c + 5;$

Problem:  
 Dependencies

Inst fetch	Inst decode	Arg fetch	Execute	Write back
Inst fetch	Inst decode	Arg fetch	Execute	Write back
Inst fetch	Inst decode	Arg fetch	Execute	Write back
Inst fetch	Inst decode	Arg fetch	Execute	Write back
Inst fetch	Inst decode	Arg fetch	Execute	Write back

```

mulq $m0
add %rax,$A[0]
mov 8*2($np),%rax
lea 32($tp),$tp
adc \ $0,%rdx
mov %rdx,$A[1]
mulq $m1
add %rax,$N[0]
mov 8($a,$j),%rax
adc \ $0,%rdx
add $A[0],$N[0]
adc \ $0,%rdx
mov $N[0],-24($tp)
mov %rdx,$N[1]
mulq $m0
add %rax,$A[1]
mov 8*1($np),%rax
adc \ $0,%rdx
mov %rdx,$A[0]
mulq $m1
add %rax,$N[1]
mov ($a,$j),%rax
mov 8($a,$j),%rax
adc \ $0,%rdx
    
```

# Out-of-Order Execution

- Execute instructions when data is available

IF	ID	AF	EX	WB
IF	ID		EX	WB
IF	ID	AF	EX	WB

Completed instructions wait in *reorder buffer* until all previous ones *retired*

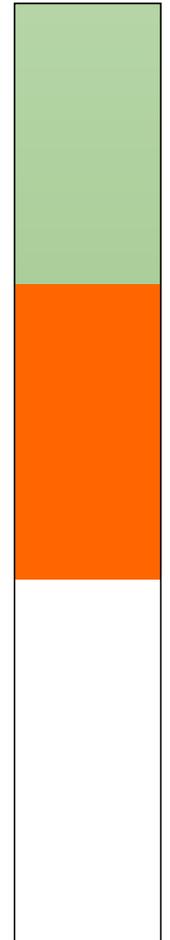

$b = 0?$

$c = a / b;$

$d = c + 5;$

$e = f + g;$

Out-of-order is speculative!

# Out-of-Order Execution

- Abandon instructions if never executed in program order

IF	ID	AF	EX	WB
IF	ID	AF	EX	WB
IF	ID	AF	EX	WB

Also useful for branches

```
c = a / b;  
d = c + 5;  
e = f + g;
```

b == 0!

# Speculative Execution and Branches

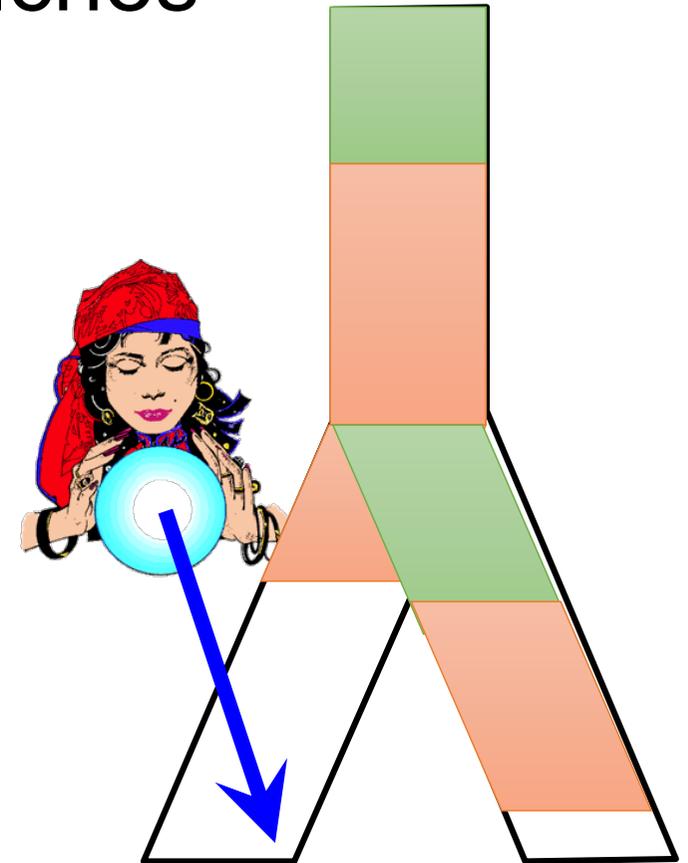

When execution reaches a branch:

- Predict outcome of branch
- Proceed (speculatively!) along predicted branch

Correct prediction: All good

Mis-prediction: Abandon and resume

Minor problem: Speculation  
pollutes cache!

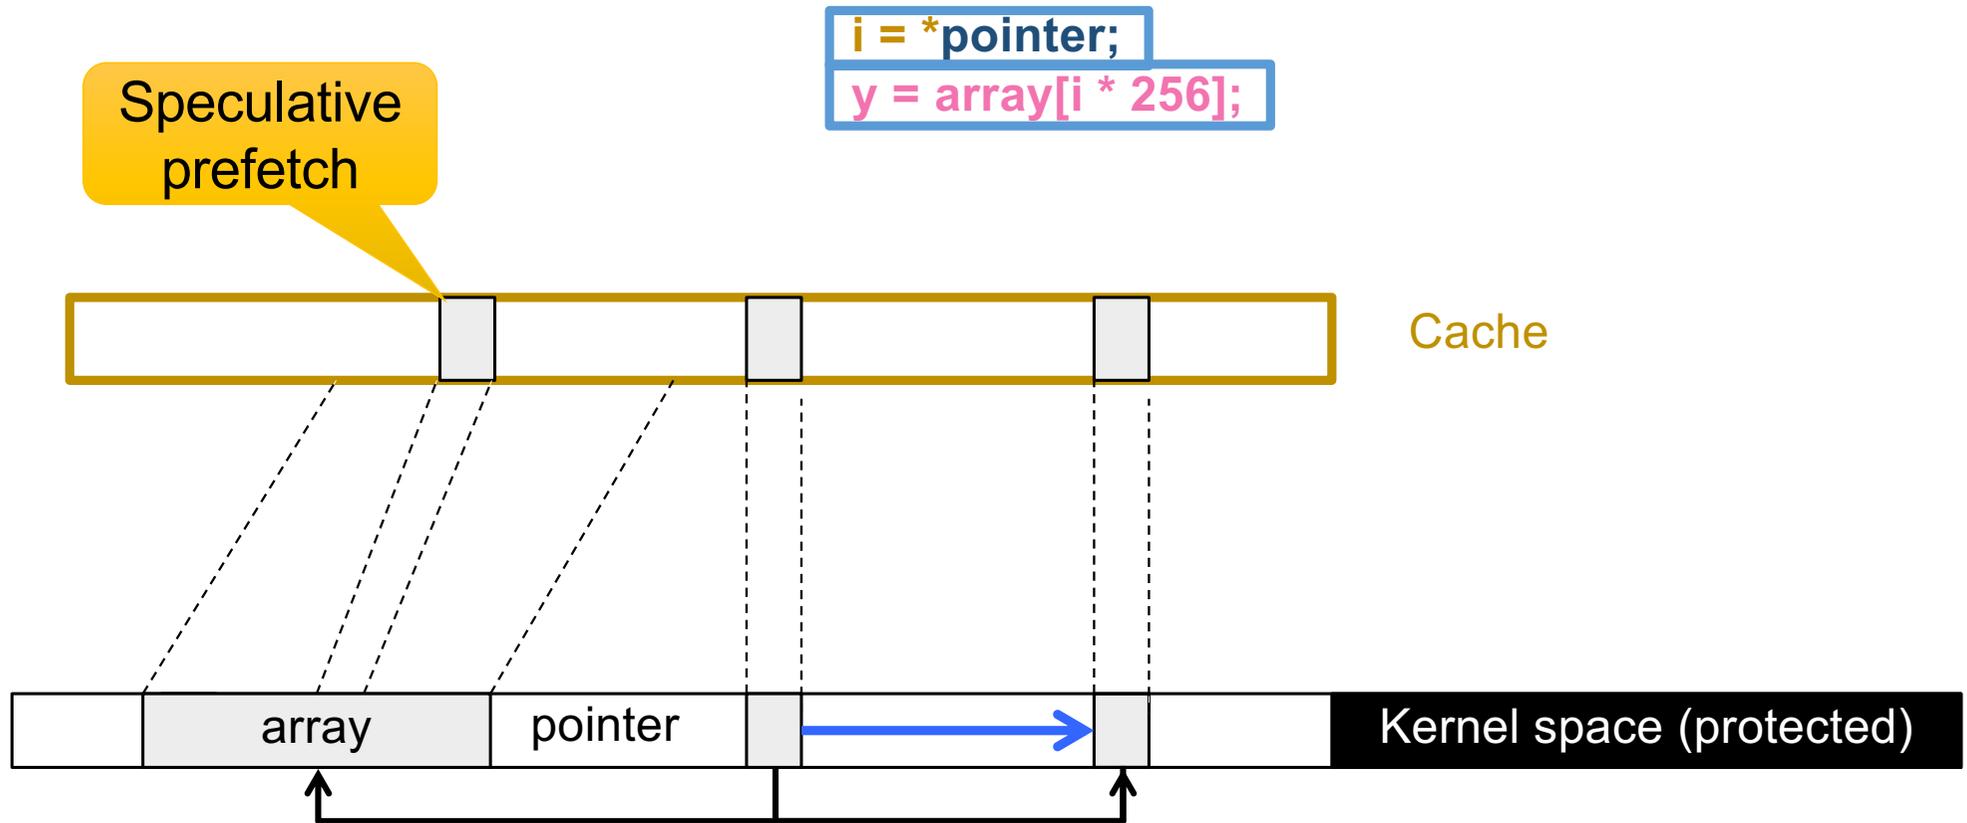

# Speculating Disaster

Meltdown

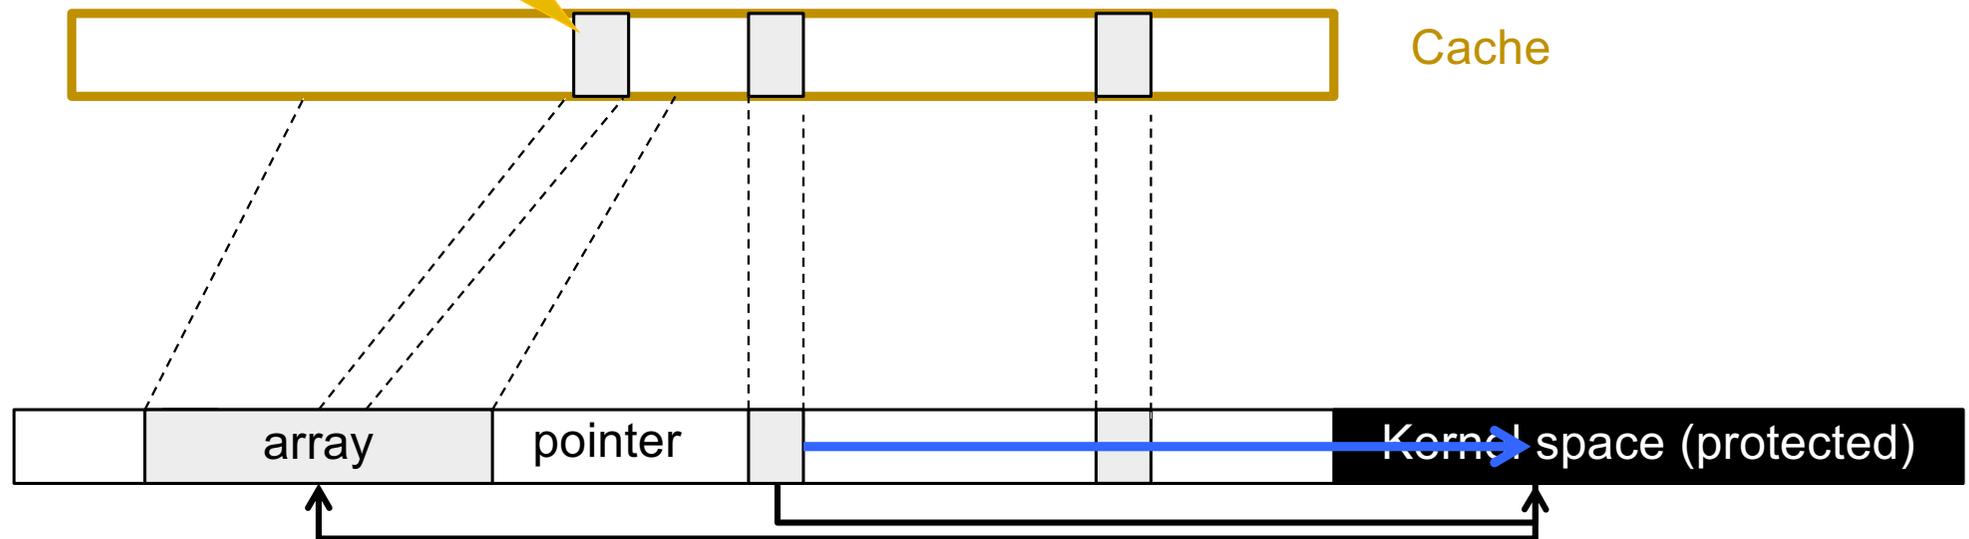

# Meltdown: Speculative Load

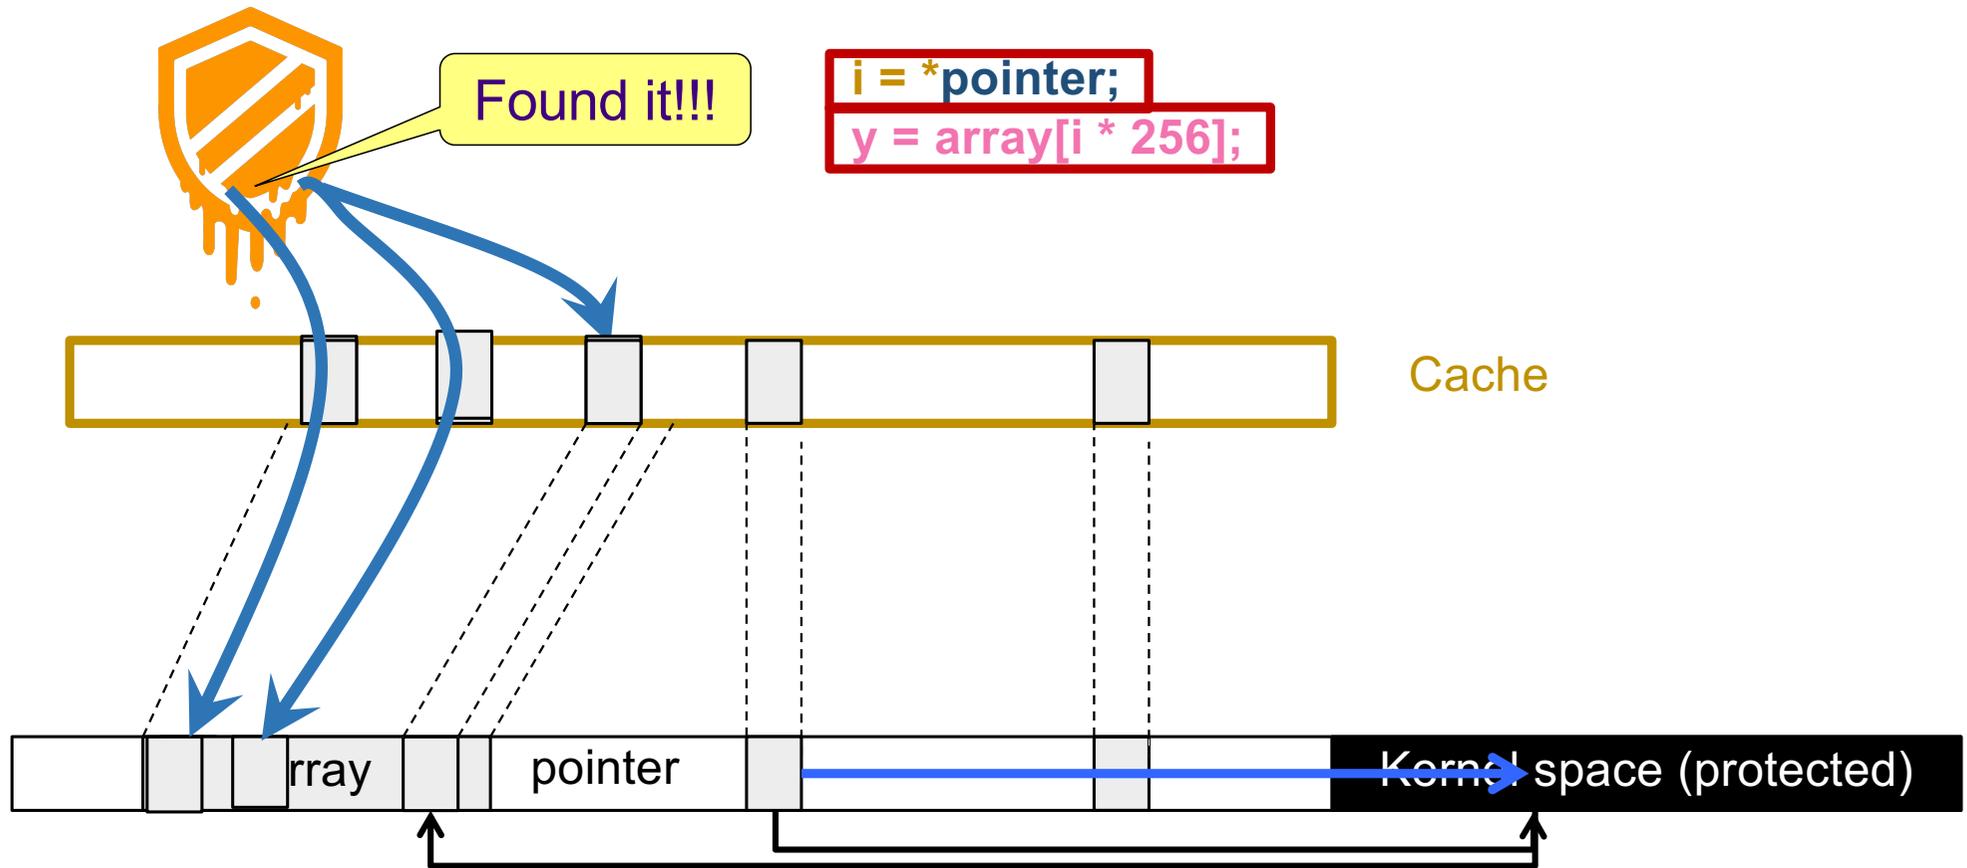

# Meltdown: Speculative Loads

Prefetch concurrent with permission check, load aborted

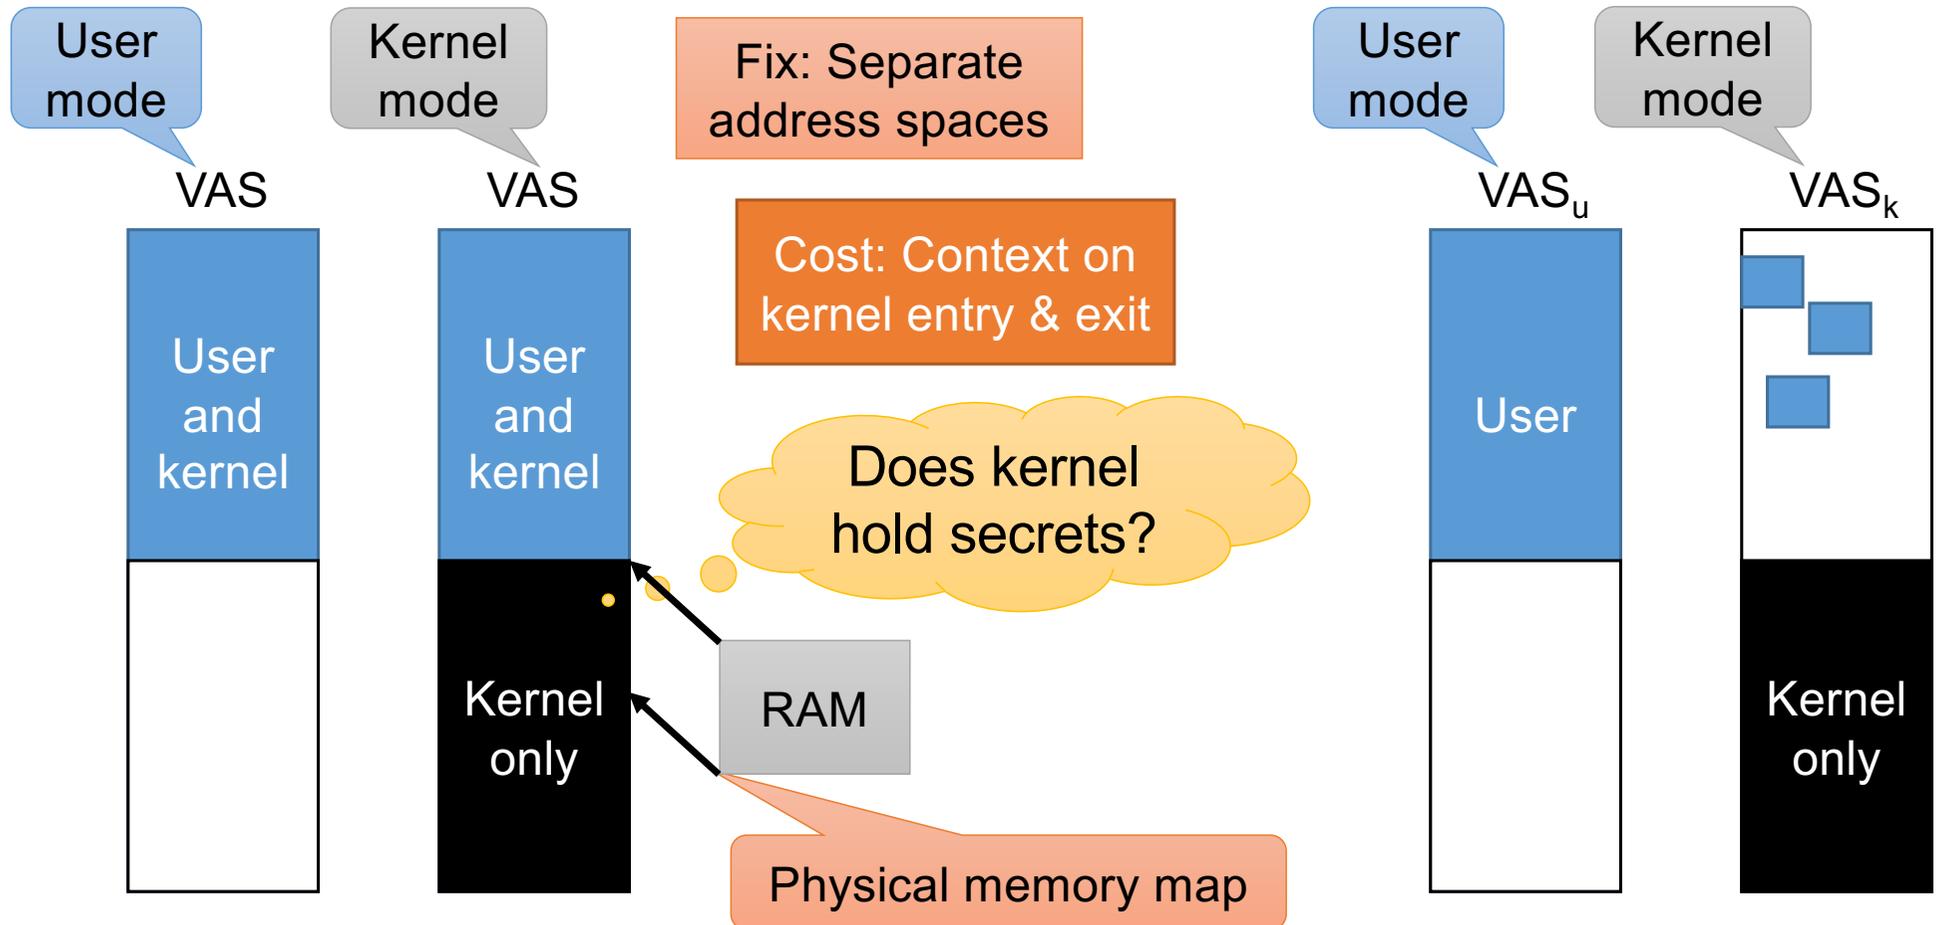

```
i = *pointer;  
y = array[i * 256];
```

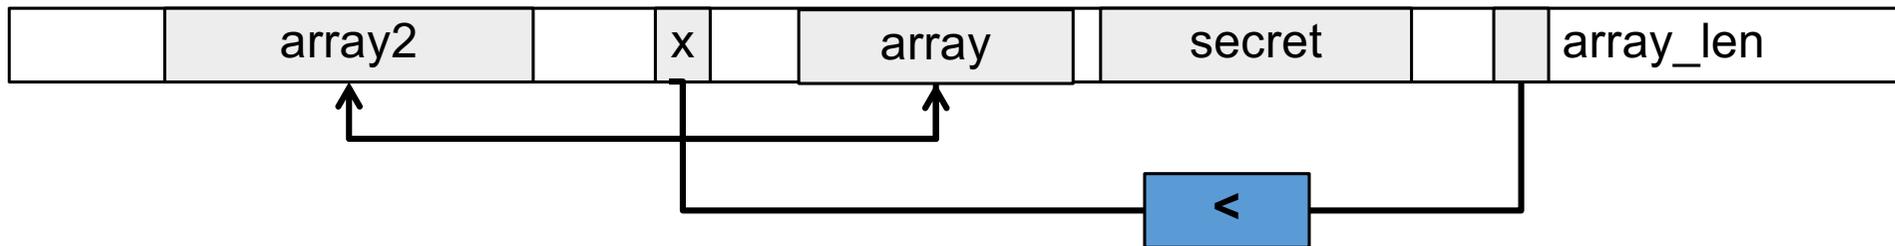

# Meltdown: Cache-Channel to Read

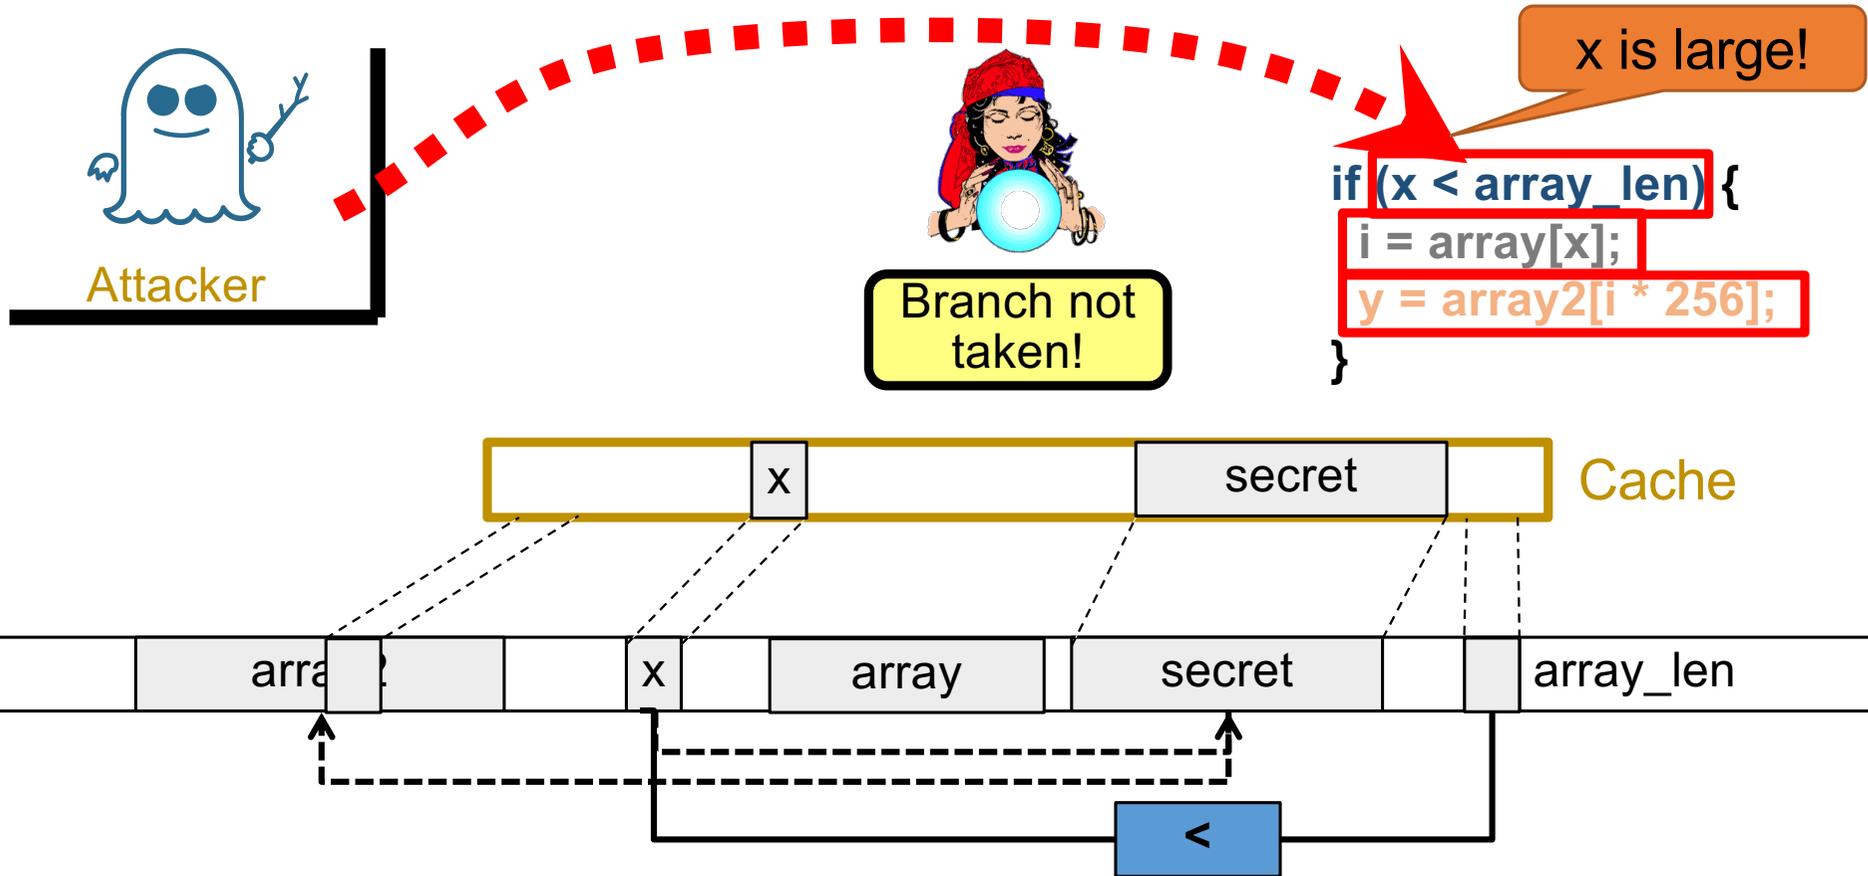

# Meltdown: Full Kernel Memory Disclosure

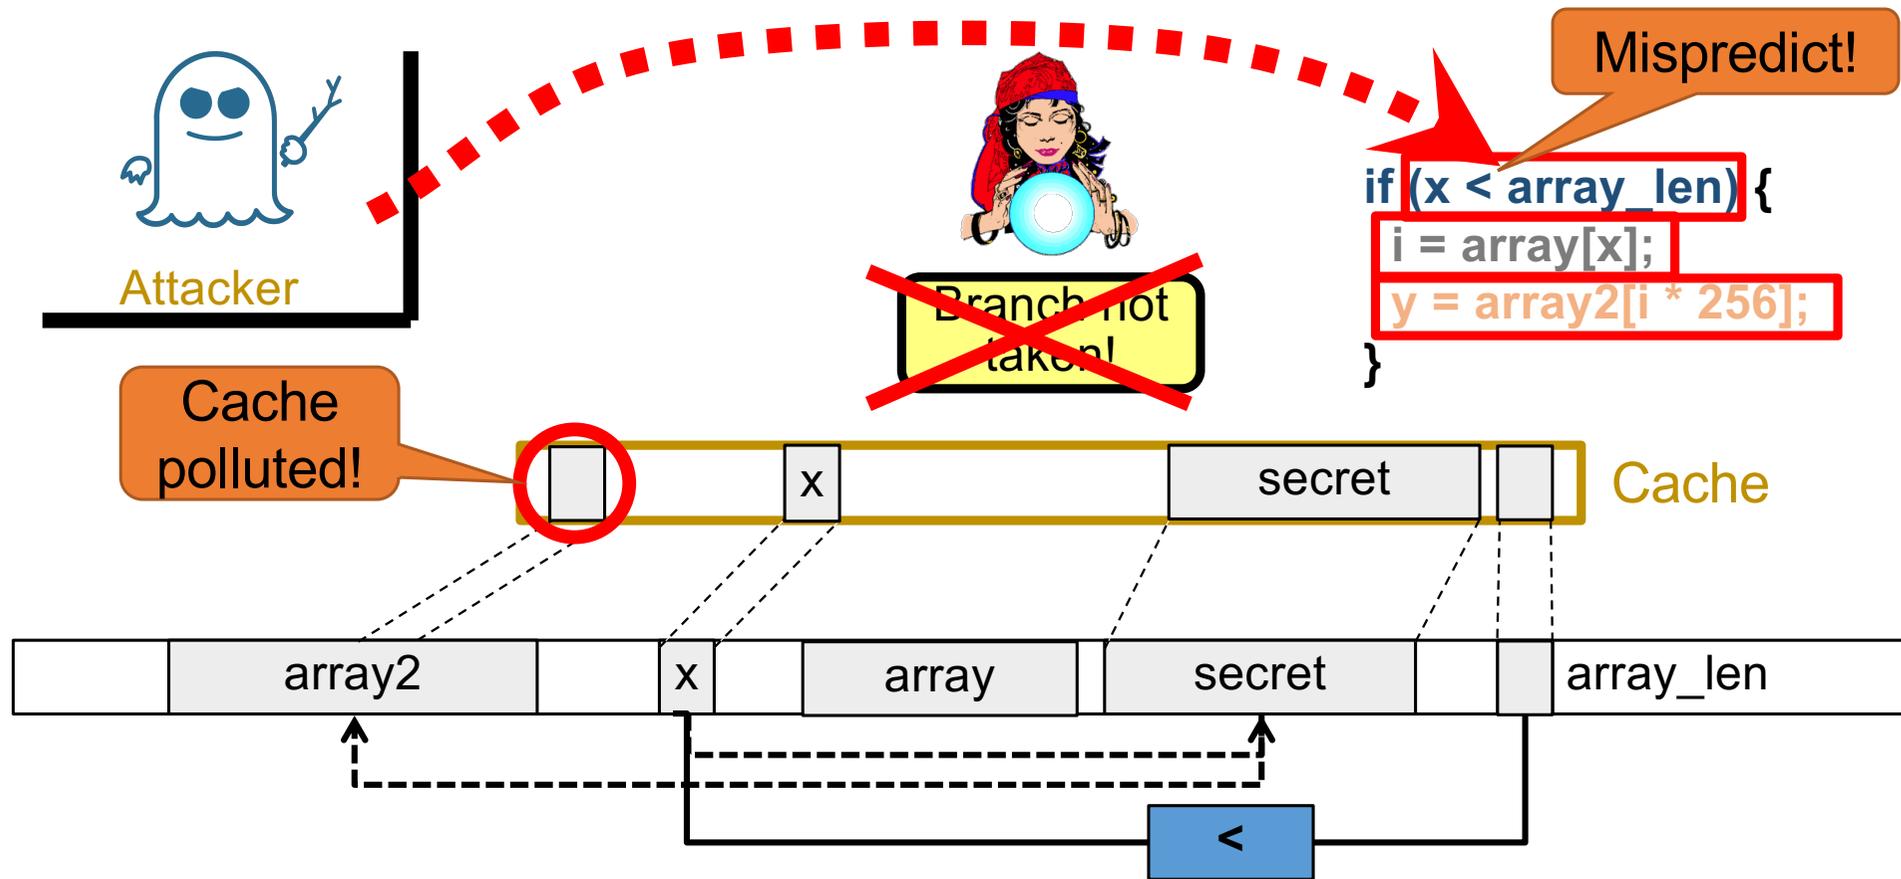

# Spectre: Branch Prediction (Variant 1)

# Spectre: Branch Prediction (Variant 1)

# Spectre: Branch Prediction (Variant 1)

# Reaction

consistent with  
spec, i.e. ISA

Steve Smith, Corporate  
vice president, Intel

“The processor is, in fact, operating as it is designed,” Smith said. “And in every case, **it's been this side-channel approach** that the researchers used to gain information even while the processor is executing normally its intended functions.”

Inevitable conclusion:

- This ISA is an insufficient contract for building secure systems
- **We need a new hardware-software contract!**
